Creating a pull request

Create a pull request to propose and collaborate on changes to a repository. These changes are proposed in a *branch*, which ensures that the `master` branch only contains finished and approved work.

In this article

- [Creating the pull request](#)
- [Further reading](#)

Anyone with read permissions to a repository can create a pull request, but you must have write permissions to create a branch. If you want to create a new branch for your pull request and don't have write permissions to the repository, you can fork the repository first. For more information, see "[Creating a pull request from a fork](#)" and "[About forks](#)."

You can specify which branch you'd like to merge your changes into when you create your pull request. Pull requests can only be opened between two branches that are different.

Note: To open a pull request in a public repository, you must have write access to the head or the source branch or, for organization-owned repositories, you must be a member of the organization that owns the repository to open a pull request.

You can link a pull request to an issue to show that a fix is in progress and to automatically close the issue when someone merges the pull request. For more information, see "[Linking a pull request to an issue](#)."

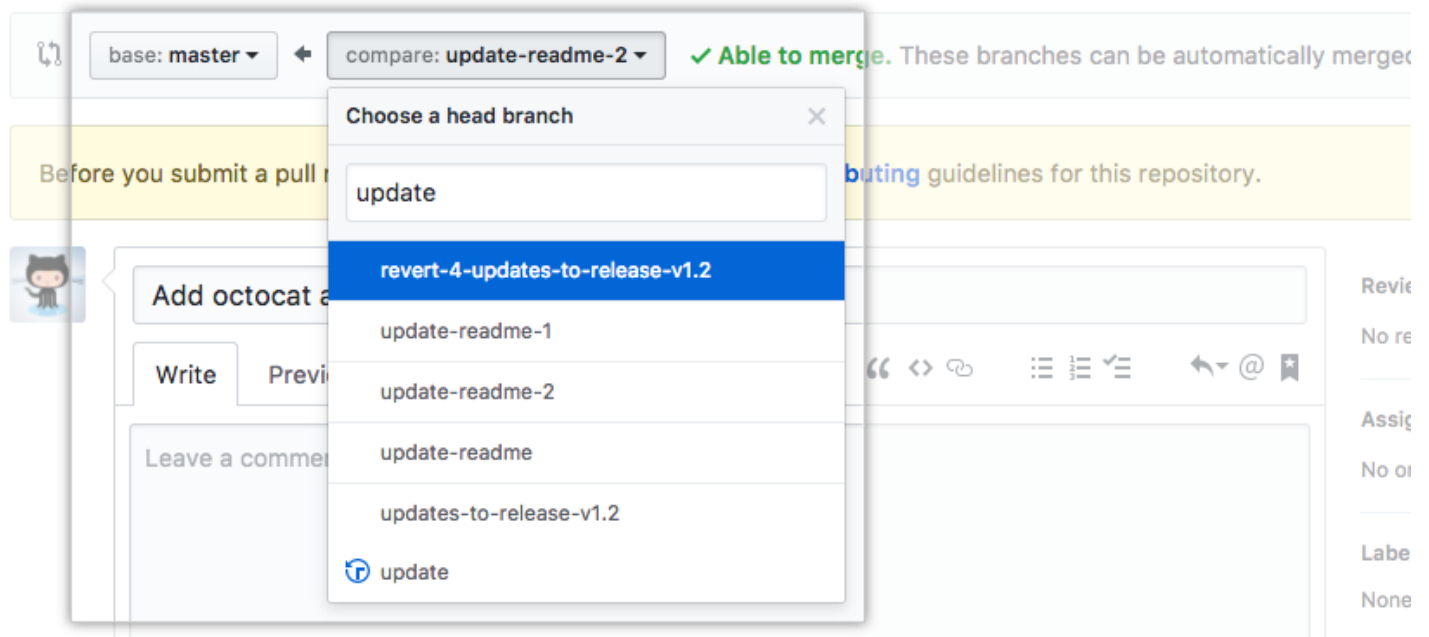

Changing the branch range and destination repository

By default, pull requests are based on the parent repository's [default branch](#).

If the default parent repository isn't correct, you can change both the parent repository and the branch with the drop-down lists. You can also swap your head and base branches with the drop-down lists to establish diffs between reference points. References here must be branch names in your GitHub repository.

Open a pull request

Create a new pull request by comparing changes across two branches. If you need to, you can also [compare across forks](#).

When thinking about branches, remember that the *base branch* is **where** changes should be applied, the *head branch* contains **what** you would like to be applied.

When you change the base repository, you also change notifications for the pull request. Everyone that can push to the base repository will receive an email notification and see the new pull request in their dashboard the next time they sign in.

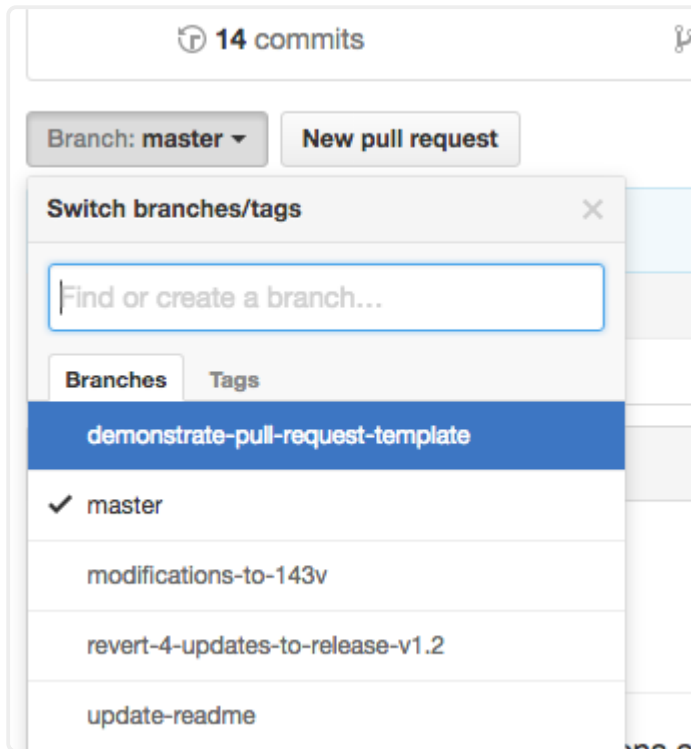

When you change any of the information in the branch range, the Commit and Files changed preview areas will update to show your new range.

Tips:

- Using the compare view, you can set up comparisons across any timeframe. For more information, see "[Comparing commits](#)."
- Project maintainers can add a pull request template for a repository. Templates include prompts for information in the body of a pull request. For more information, see "[About issue and pull request templates](#)."

Creating the pull request

- 1 On GitHub, navigate to the main page of the repository.
- 2 In the "Branch" menu, choose the branch that contains your commits.

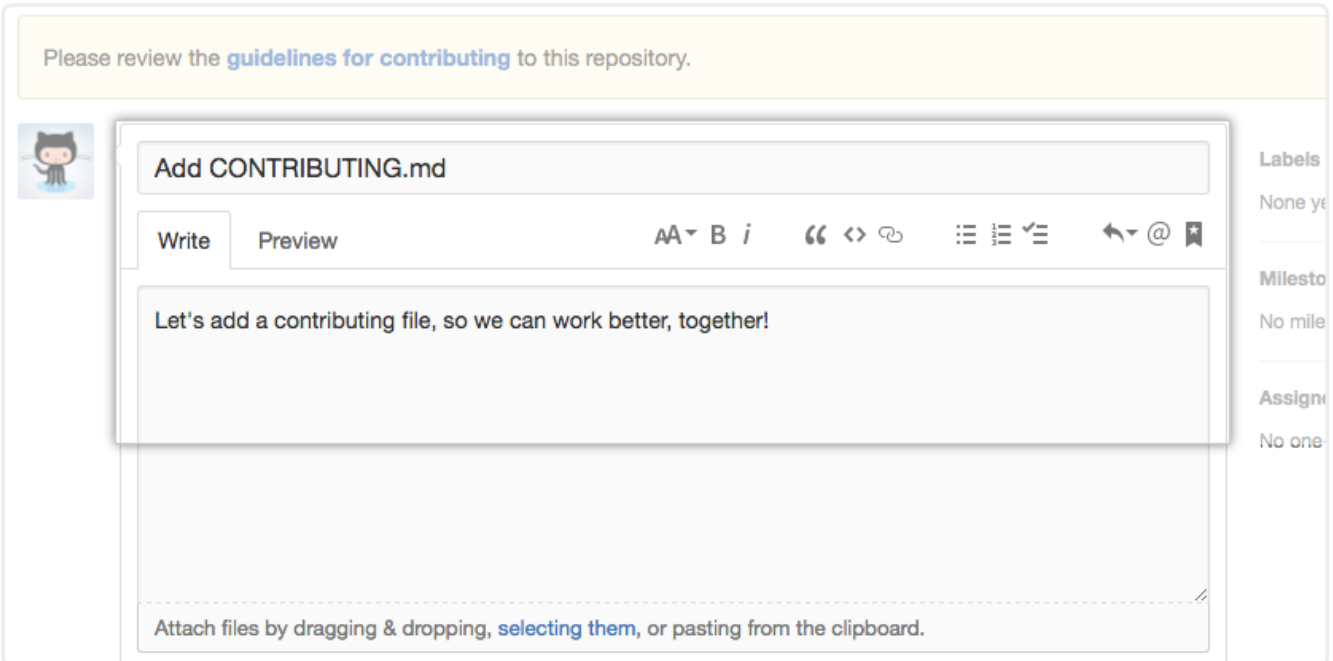

- 3 To the right of the Branch menu, click **New pull request**.

- 4 Use the *base* branch dropdown menu to select the branch you'd like to merge your changes into, then use the *compare* branch drop-down menu to choose the topic branch you made your changes in.

- 5 Type a title and description for your pull request.

Please review the [guidelines for contributing](#) to this repository.

 Add CONTRIBUTING.md
